Inhaltsverzeichnis

Project Summary	3
Zusammenfassung.....	5
1 Kurzdarstellung des Projekts.....	7
1.1 Aufgabenstellung und Projektziele	7
1.2 Voraussetzungen des Projekts.....	8
1.3 Projektplanung und Ablauf	8
1.4 Wissenschaftlich-technischer Stand bei Projektbeginn	10
1.5 Zusammenarbeit mit anderen Stellen.....	11
2 Darstellung der Ergebnisse des Projekts	12
2.1 Treibstoffmatrix.....	12
2.1.1 Zu untersuchende Kraftstoffe	12
2.1.2 Nicht berücksichtigte Kraftstoffe:	14
2.2 Messungen an Prüfstand und Vollanlage.....	14
2.2.1 Messprogramm.....	14
2.2.2 Messparameter.....	18
2.2.3 Emissionseigenschaften von biogenen Treibstoffen	19
2.3 Modellsimulationen.....	27
2.3.1 Global installierten Leistung für Schiffsantriebe und Stationärmotoren	27
2.3.2 Emissionskataster für Nicht-CO ₂ Emissionen.....	35
2.3.3 Treibhausgas - Emissionen aus den Lebenswegen von Bioenergieträgern...	39
2.3.4 CO ₂ - Reduktionspotential	44
2.3.5 CO ₂ - Klimawirkung.....	49
2.3.6 Effekte von Nicht - CO ₂ Komponenten	62
2.4 Bewertung und Empfehlungen	73
2.4.1 Bewertungskriterien	73
2.4.2 CO ₂ – Effekte	76
2.4.3 Empfehlungen zur Nutzung biogener Treibstoffe	77
2.5 Zitierte Literatur	78
3 Verwertungsplan	82
4 Publikationen und Präsentationen aus dem Projekt.....	83
5 Danksagungen	83
6 Anhang - Treibhausgasemissionen biogener Energieträger	85
im Vergleich zu fossilem Diesel und Schweröl –	85
Endbericht der Studie des Öko-Instituts.....	85

Project Summary

Study Objectives and Structure

The use of biofuels for stationary power generation or propulsion in shipping gains increasing importance in the framework of CO₂ reductions and the use of energy from renewable sources. The knowledge on emission characteristics of various biofuels and resulting climate impacts however is very limited. BIOCLEAR considers the quantification of all key climate-active exhaust constituents as a very important task not only for fossil fuels but also for fuels from renewable sources. The evaluation of the climate impact of biofuels requires precise knowledge on the differences in emission characteristics between conventional and biofuels.

BIOCLEAR investigated the emission of CO₂, NO_x, hydrocarbon compounds, SO₂, H₂SO₄ and particulate matter in terms of particle number, particle size, and chemical composition from medium-speed four-stroke large diesel engines for different fuel types. The selected fuel matrix included heavy fuel oil (HFO) with a fuel sulphur content of 2.17 weight-% (wt-%) as the fossil high-sulphur reference fuel, marine gas oil (MGO) with a fuel sulphur content of < 0.1 wt-% as a fossil low-sulphur fuel, and palm oil, soy bean oil, sunflower oil and waste edible fat as fuels from biogenic sources.

The simultaneous consideration of climate-active trace species like NO_x, particulates and sulphur-containing particle precursors on one hand and of the most important climate-active exhaust constituent CO₂ on the other hand allowed for the investigation of trade-off effects of CO₂ emissions reduction and potentially increasing emissions of other climate-active trace constituents. Accompanying model studies using a CO₂ response model for the treatment of the CO₂ emissions, and a coupled climate chemistry model for the treatment of direct and indirect aerosol effects on climate investigated the climate response in case of replacing heavy fuel oil by biofuels. The greenhouse gas emissions associated with the production and use of the biofuels were included by means of a fuel lifecycle analysis which also considered land use changes associated with the growth of energy plants for the production of biofuels.

This set of joint test rig studies and model studies forms the basis for recommendations of reasonable applications of biofuels in terms of climate protection. As a whole, BIOCLEAR provides decision guidance and guidance on technological realisation for a world-wide use of fuels from renewable sources in the investigated applications of large diesel engines.

Emission Properties

The investigated set of biofuels demonstrated good combustion properties in the single-cylinder four-stroke test engine. No significant increase in engine degradation and corrosion was observed for biofuel use. Fuel characteristics and emissions properties of the investigated fuels are summarised as follows:

Energy content and specific CO₂ emissions:

Energy content per mass:	HFO	40.4 MJ kg ⁻¹
	MGO	43.0 MJ kg ⁻¹
	Biofuels (av.)	37.3 MJ kg ⁻¹
Specific CO ₂ emissions (75% load)	HFO	679 g CO ₂ kWh ⁻¹
	MGO	639 g CO ₂ kWh ⁻¹
	Biofuels (av.)	655 g CO ₂ kWh ⁻¹
